8 Maintaining the Definition of Done **5**

1 Purpose of the Document

This document defines the **Definition of Done (DoD)** for the NAOMI team. It establishes a common understanding of when work can be considered complete within the NAO Robot Exercise System project. The DoD helps the team maintain consistent quality, track progress in Jira, and avoid marking unfinished work as completed.

NAOMI follows a Scrumban approach. Issues are managed on a Jira board using five states: **To Do, In Progress, In Review, Testing, and Done**. The DoD describes the conditions that must be met before an issue is moved to the final state.

2 Scope and Responsibilities

The DoD applies to development tasks, bug fixes, documentation, research, experiments, and other deliverables tracked in Jira. Not every technical criterion applies to every task: for example, a documentation-only task does not require new source code. However, every completed task must meet its acceptance criteria and provide a verifiable result.

The **assignee** is responsible for completing the work, keeping Jira up to date, and providing evidence of completion. The **reviewers** check the result independently. The team confirms that the necessary reviews and tests have been completed before closing the issue.

3 General Definition of Done

A Jira issue can be moved to **Done** only when all applicable criteria below have been satisfied:

- The intended result is complete and meets the issue's acceptance criteria.
- The output can be reviewed or verified by another team member.
- Relevant changes, decisions, and results are recorded in Jira or linked documentation.
- Required reviews have been completed and important comments have been resolved.

- Appropriate testing or validation has been performed, with no known unresolved critical defects caused by the change.
- Documentation has been created or updated when necessary.
- The Jira issue contains a link to the final result, such as a pull request, document, experiment report, or demonstration.
- The issue status accurately reflects the actual progress.

If a requirement cannot be satisfied, the issue must not be marked Done without an explicit team decision and a documented follow-up.

4 Definition of Done for Development Tasks

For tasks involving source code, the following criteria apply:

- The implementation meets the agreed requirements and follows the project's coding conventions.
- The code is committed to a GitHub branch linked to the corresponding Jira issue.
- Necessary tests have been completed successfully.
- Relevant documentation has been updated where required.
- All required automated checks pass, if available.
- The changes have been merged into the appropriate target branch following the review process described below.

4.1 Pull Request Review and Approval

All code changes must be submitted through a Pull Request before being merged into the main branch.

The approval requirements depend on the PR author:

- **Repository Owners and Maintainers:** Members responsible for the repository may merge their own Pull Requests without additional approvals.

- **Other Team Members:** Pull Requests require two approvals: one from a repository owner or maintainer and one from another assigned reviewer.

Before merging, all requested changes must be addressed and blocking review comments resolved. Reviewers should verify correctness, code quality, and compliance with project requirements.

Repository owners and maintainers remain responsible for the quality of changes they merge without additional review.

5 Review and Testing Process

The **In Review** and **Testing** states represent two different checks. Review focuses on implementation quality and completeness; testing focuses on whether the result behaves as expected.

Table 1: Verification stages before completion

Jira status	Main activity	Exit condition
In Review	Review the implementation or deliverable and provide feedback.	Required reviews are completed and blocking comments resolved.
Testing	Execute relevant functional, integration, or manual checks.	Expected behaviour is verified and significant defects are resolved.
Done	Confirm the issue meets the applicable DoD criteria.	Evidence is linked and the final result is ready to use.

For the NAO robot project, testing may include verifying motion sequences, robot behaviour, input processing, or communication between components, depending on the task.

If testing reveals a defect, the issue should return to an appropriate working state or a related bug issue should be created. Moving an issue to Done does not replace the need to record unresolved problems.

6 Definition of Done for Non-Code Tasks

6.1 Documentation

A documentation task is complete when its content is accurate, readable, consistent with the current implementation, and stored in the agreed team location. The relevant team member has reviewed it, and any essential corrections have been applied. Meeting notes are considered complete once the main decisions, action items, responsible people, and relevant Jira links have been recorded and shared with the team.

6.2 Research and Experiments

Research or experiment tasks are complete when the objective, method, results, and conclusions are documented. The result must be accessible to other team members, including any limitations or remaining uncertainties. A negative or inconclusive result can still be Done if the agreed work was carried out and its outcome is documented.

7 Completion Checklist in Jira

Before moving a task to Done, the assignee should verify the following short checklist. Items that do not apply should be marked as not applicable rather than silently ignored.

- ☐ Acceptance criteria are met.
- ☐ The result is linked in Jira.
- ☐ Review and required approvals are complete.
- ☐ Relevant tests or validation have passed.
- ☐ Documentation is up to date.
- ☐ There are no unresolved blocking problems.
- ☐ The final status in Jira is correct.

8 Maintaining the Definition of Done

The team may update this definition during retrospectives or when the project's tools and workflow change. Any change should be discussed with the team, documented,

and applied consistently to future work. The DoD should remain practical: its purpose is to support reliable delivery, not to create unnecessary administrative steps.
