1 Purpose of the Document

This document defines how the NAOMI team creates, reviews, stores, and maintains project documentation. Its purpose is to keep technical information, meeting outcomes, and sprint records understandable and accessible to all team members throughout the development of the team project.

Documentation should explain not only what was implemented, but also important decisions, known limitations, and instructions needed to continue the work. It should be concise enough to remain useful and detailed enough that another team member can understand the documented activity without additional explanations from its author.

2 Scope and Responsibilities

The methodology applies to documentation produced within the NAOMI team project, including technical documentation, meeting notes, sprint retrospectives, internal methodologies, and supporting guides.

The team member responsible for a task is normally responsible for keeping its related documentation accurate. Documentation may also be prepared by another member, provided that the person familiar with the implementation reviews the technical details. All team members are encouraged to report missing or outdated information.

The documentation is intended primarily for the team, project supervisors, and other readers who need to understand the project's progress and results.

3 Technical Documentation

Technical documentation describes the parts of the system developed by the team, their purpose, and how they work together. Depending on the task, it may cover system architecture, interfaces, data structures, APIs, configuration, installation, or testing procedures.

When a feature is implemented or significantly changed, the responsible team member should update the relevant documentation. The description should include the goal of the feature, its main components, dependencies, and any important assumptions or restrictions. Diagrams, screenshots, and short code examples can be used when they make the explanation easier to follow.

Before the documentation is considered complete, the developer familiar with the

corresponding code should check it for technical accuracy. Relevant documentation should also be considered during code review so that the written description does not contradict the implementation.

Where the project contains several independent components, each component may have its own documentation. A higher-level overview should explain how these components fit together.

4 Meeting Records

During each team meeting, one team member is responsible for taking written notes.

The meeting notes should include the main topics discussed, identified problems, important decisions, and tasks assigned to individual team members.

Each meeting record should contain:

- Date of the meeting and list of participants.
- Main topics discussed during the meeting.
- Decisions made by the team.
- Identified problems or potential risks.
- Action items, responsible members, and expected deadlines.

After the meeting, the notes are made available to all team members. Any new tasks resulting from the discussion should be added to Jira or linked to existing issues.

Meeting notes are stored with the team's project documentation so that members can review previous discussions and decisions when needed.

5 Internal Methodologies

In addition to technical descriptions, the NAOMI team maintains short methodology documents for recurring activities. These documents help team members follow a consistent approach without introducing unnecessary administrative work.

Examples include backlog management in Jira, the Scrumban workflow, code review, testing, version control, and documentation itself. Each methodology should clearly describe its purpose, scope, main steps, and responsibilities. It should be revised when the team's working practices change.

The current version of a methodology should be easy to find in the team's shared documentation and, where appropriate, linked from the team website.

6 Sprint Retrospective Documentation

At the end of a sprint, the team reflects on its work and discusses possible improvements. Although NAOMI uses Scrumban, regular retrospectives help the team evaluate both sprint outcomes and the flow of tasks across the Jira board.

The discussion should cover the following questions:

- What went well during the sprint?
- Which planned activities were not completed, and why?
- What problems or blockers did the team encounter?
- What should be improved in the next sprint?

One participant should record the most important observations and decisions. The retrospective does not need to reproduce every statement verbatim; it should summarise common findings and concrete improvement proposals.

6.1 Retrospective Outcomes

The final record should distinguish between observations and agreed actions. Where an improvement requires follow-up work, it should have a responsible person and, if appropriate, a related Jira issue. At the next retrospective, the team can check whether previously agreed changes were useful.

Team members who could not attend should have access to the summary and an opportunity to provide additional comments.

7 Other Documents and Storage

Additional materials may be created during the project, such as setup guides, user instructions, research notes, test reports, diagrams, or demonstrations. These materials should be stored alongside the relevant project documentation rather than remaining only in private messages or on individual computers.

Files should use descriptive names and be organised by topic. When an updated version replaces an older one, the team should avoid keeping several unlabelled copies that could cause confusion. Documents referenced in Jira should be linked from the corresponding issues whenever this is useful.

Project documentation intended for broader access should also be linked or published through the NAOMI team website, according to the team's agreed sharing rules. Internal notes or information that should not be public should remain in the appropriate restricted team workspace.

The goal is to keep documentation current, searchable, and useful for future team members and project evaluation.
